Department of Information Technology, Faculty of Computing

Learning Objectives: Students will be able to learn UNIX process management system calls and library functions.

Exercise 1

Write a C program to print the process ID of the process and it's parent process ID.

fork ( ) System call

Exercise 2

```
#include <stdio.h>
main()
{
        printf("I am Parent\n");
        fork();
        printf("Hello World...!\n");
}
```

Exercise 3

```
#include <stdio.h>
main()
{
        int ret;
        printf("I am Parent\n");
        ret = fork();
        printf("Return Value: %d\n", ret);
}
```

Department of Information Technology, Faculty of Computing

---

getpid ( ) and getppid ( ) system calls

Exercise 5

```c
#include <stdio.h>
main()
{
        int ret;
        printf("Hello World\n");
        ret = fork();

        if(ret == 0){
             printf("I am Child and Return Value=%d\n", ret); printf("Child PID: %d\n",
                                                                 getpid());
                printf("Child's Parent PID: %d\n", getppid());
        }
        else{
                printf("I am Parent and Return Value=%d\n", ret);
                printf("Parent PID: %d\n", getpid());
        }
sleep(20);
}
```

execl ( ) system call

Exercise 6

```c
#include <stdio.h>
main()
{
        printf("Here comes the date. \n");
        execl("/bin/date", "date", 0);  /*0 means end-of-arguments */
        printf("That was the date. \n");
}
```

Department of Information Technology, Faculty of Computing

Exercise 7

```c
#include <stdio.h>
main()
{
    printf("Here comes the date. \n");
    fork();
    execl("/bin/date", "date", 0);
    printf("That was the date. \n");
}
```

Why did you get date two times? and Why didn't you get first print statement two times?
……………………………………………………………………………………………………

Exercise 8

system ( ) library function

```c
#include <stdio.h>
main()
{
        printf("Here comes the date. \n");
        system("date");
        printf("That was the date");
}
```

Zombi Process

Exercise 10

```c
#include <stdio.h>
main()
{
        int id;
        if ((id = fork())== 0)
        {
                printf("I am child process \n");
        }
        else
        {
                while(1)
                sleep(100);
        }
}
```

Department of Information Technology, Faculty of Computing

_____

<u>Orphan Process</u>

Exercise 11

```
#include <stdio.h>
main()
{
        int id;
        if ((id = fork())== 0)
        {
                printf("I am child process \n");
                sleep(10);
        }
        else
        {
                printf("I am parent process \n");
        }
}
```
